

CUCUMBER PROJECT DOCUMENTATION

To execute the project is only necessary to be in the root path of it and execute "mvn test". There are 4 possible Use Cases with their definitions and validations.

APPIUM PROJECT DOCUMENTATION

In that part I had an issue, it was impossible to launch the app at starting of each test defining it in the "Desired Capabilities". I tried it in different ways but I can't. So it's necessary to have the app opened to launch the tests. Also related with it, is necessary to execute first all "Expect to fail" test and after the happy path test. (To avoid uninstall and reinstall manually the app).

There are a ConstantIds file to avoid repeated and hardcoded ids values and to have it on two files to make the project more scalable.
